CONGRUENT NUMBER PROBLEM

Def. A ^{positive} integer n is called congruent if there exists a right triangle  $x, y, z \in \mathbb{Q}$ $\frac{1}{2}xy = n$.

Question: Given $n \in \mathbb{Z}_{>0}$ is it congruent?

It is enough to analyze the values $n \in \mathbb{Z}_{>0}$ in squarefree.

$$n = m^2 n' \quad n' \text{ squarefree}$$

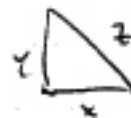

$$\frac{1}{2}xy = n$$

$$\frac{1}{2}x'y' = n'$$

$$\begin{aligned} \longleftrightarrow \\ x = mx' \\ y = my' \end{aligned}$$

• We shall refer to  $x < y < z$ and

Proposition Given $n \in \mathbb{Z}_{>0}$ squarefree, \exists a right triangle $x < y < z$ $\frac{1}{2}xy = n$ $x, y, z \in \mathbb{Q}$ iff $\exists x \in \mathbb{Q}$ s.t. $x, x-n, x+n$ are in $(\mathbb{Q}^*)^2$.

$$x, y, z$$

$$\longleftrightarrow x = \left(\frac{z}{2}\right)^2$$

$$\begin{aligned} x &= \sqrt{x+n} - \sqrt{x-n} \\ y &= \sqrt{x+n} + \sqrt{x-n} \\ z &= 2\sqrt{x} \end{aligned}$$

$$\longleftrightarrow x$$

Pr.

$$\frac{1}{2}XY = n$$

$$x^2 + y^2 = z^2$$

\Rightarrow

$$(x+y)^2 = z^2 + 4n$$

$$(x-y)^2 = z^2 - 4n$$

$$\left(\frac{x+y}{2}\right)^2 = \left(\frac{z}{2}\right)^2 \pm n$$

$$x = \left(\frac{z}{2}\right)^2$$

$x, x+n, x-n$ all squares.

So map is well-defined.

(map is surjective)

$$x = u^2 \text{ define } X = \sqrt{x+n} - \sqrt{x-n}, \quad Y = \sqrt{x+n} + \sqrt{x-n}, \quad z = 2\sqrt{x}$$

then show $x^2 + y^2 = z^2$ and $\frac{1}{2}XY = n$.

(map is injective)

$$\begin{aligned} \text{if } X_0, Y_0, z_0 &\longrightarrow x \\ X_1, Y_1, z_1 &\longrightarrow x \end{aligned}$$

$$\Rightarrow \begin{aligned} X_0^2 + Y_0^2 &= z_0^2 & \frac{1}{2}X_0Y_0 &= n \\ X_1^2 + Y_1^2 &= z_0^2 & \frac{1}{2}X_1Y_1 &= n. \end{aligned}$$

\Downarrow

$$(X_0 + Y_0)^2 = z_0^2 + 4n = (X_1 + Y_1)^2$$

$$(X_0 + Y_0) = X_1 + Y_1$$

$$X_0Y_0 = X_1Y_1 \quad \Rightarrow \quad X_0 = X_1, \quad Y_0 = Y_1 \quad \text{given } X_0 < Y_0, X_1 < Y_1$$

$$\left\{ \begin{aligned} X, Y, z &\longmapsto x = \left(\frac{z}{2}\right)^2 \\ x^2 + y^2 &= z^2 \\ \frac{1}{2}XY &= n \end{aligned} \right.$$

$$(X \pm Y)^2 = z^2 \pm 4n$$

(multiply 2 relations)

$$\left(\frac{X^2 - Y^2}{4}\right)^2 = \left(\frac{z}{2}\right)^4 - n^2$$

\Downarrow

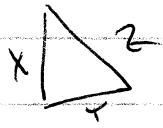

$$v = \frac{X^2 - Y^2}{4} \quad u = \frac{z}{2}$$

$$u^4 = v^2 + n^2$$

$$u^6 - n^2 u^2 = (uv)^2 \quad \text{Denote} \quad \begin{aligned} u^2 &= x \\ uv &= y \end{aligned}$$

$$\text{Then } x^3 - n^2 x = y^2 \quad (*)$$

Look for necessary conditions on a solution of (*) s.t.

it corresponds to a triple X, Y, Z  $\frac{1}{2}XY = n$.

- ① x must be the square of a rational.
- ② x must have 2 as a factor of its denominator.

X, Y, Z

$$\frac{1}{2}XY = n$$

$\exists a \in \mathbb{Q}$ ax, ay, az is a reduced Pythagorean triple

Suppose numerator of Z is even.

aZ is also even or else a is even

③ The numerators of x and n do not have any primes in common.

$$(p \text{ odd}) \quad p \mid \text{num of } x \Rightarrow p \mid \text{num. of } x \pm n \Rightarrow$$

$$p \mid \text{num of } \left(\frac{x \pm y}{2}\right)^2 \Rightarrow p \mid \text{num of } \frac{x \pm y}{2} \Rightarrow p \mid \text{num of } x \text{ num of } y,$$

$$\Rightarrow p^2 \mid \text{num of } \frac{xy}{2} \Rightarrow p^2 \mid n \text{ (impossible)}$$

$p=2$ also contradiction.

Proposition. (x, y) is a rational sol. of $y^2 = x^3 - n^2x$

Satisfying

(i) $x \in \mathbb{Q}^2$

(ii) the denominator of x is even

(iii) the num. of x and n do not have any common prime factors. Then \exists a triple $x, y, z \in \mathbb{Q}$ s.t. $\frac{1}{2}xy = n$.

Pf. $x = (s/t)^2$ $\gcd(s,t) = 1$, $s, t \in \mathbb{Z}$.

$u = (s/t)^2$

$v = y/u \implies v^2 = \frac{y^2}{u^2} = \frac{y^2}{x} = x^2 - n^2$

so $n^2 + v^2 = x^2$

$n \in \mathbb{Z} \implies x, v$ have the same denominator t^2

$x, v, n \implies t^2x^2 = t^2n^2 + t^2v^2$

t^2x, t^2n, t^2v is a reduced pythagorean triple.

$\implies \begin{cases} p \mid s^2 \\ p \nmid t \end{cases} \implies p^2 \mid t^2x$

$t^2u = 2ab$

$t^2v = a^2 - b^2$

$t^2x = a^2 + b^2$

$x = \frac{2a}{t}$

$y = \frac{2b}{t}$

$z = 2a$
